

What it does for you

One-form sign in / sign up: a customer types an email and either logs in or gets an instant account, with an optional phone field for pickup alerts — plus the readable My Account styling.

What I need from you

Everything below is something only the store owner can supply or decide — the code side is finished and waiting for these values.

1. Privacy policy and terms pages

The form links to them; the text is yours.

Publish them under Settings → Privacy, or send text and I publish.

2. Transactional email

New-account and password emails must arrive.

Same SMTP provider as Auctions (one account covers the site).

3. Bot protection choice

Instant registration attracts bots; I can wire reCAPTCHA v3 or Cloudflare Turnstile once you pick one.

Create the site in the provider's console and send the site key + secret key.

4. Phone field policy

Optional today.

Required / optional / hidden — and whether pickup-ready alerts should go by SMS (Twilio) later.

Optional / later

- Social login (Google/Apple) — needs their developer console apps.
- SMS pickup alerts.

How you will know it is working

- Enter a brand-new email at /my-account: account created and logged in, welcome email received.
